

A. Calibration selection on (Jaccard, Confirm) plane (lex)

Eligible: Top-10 lex candidates (black).

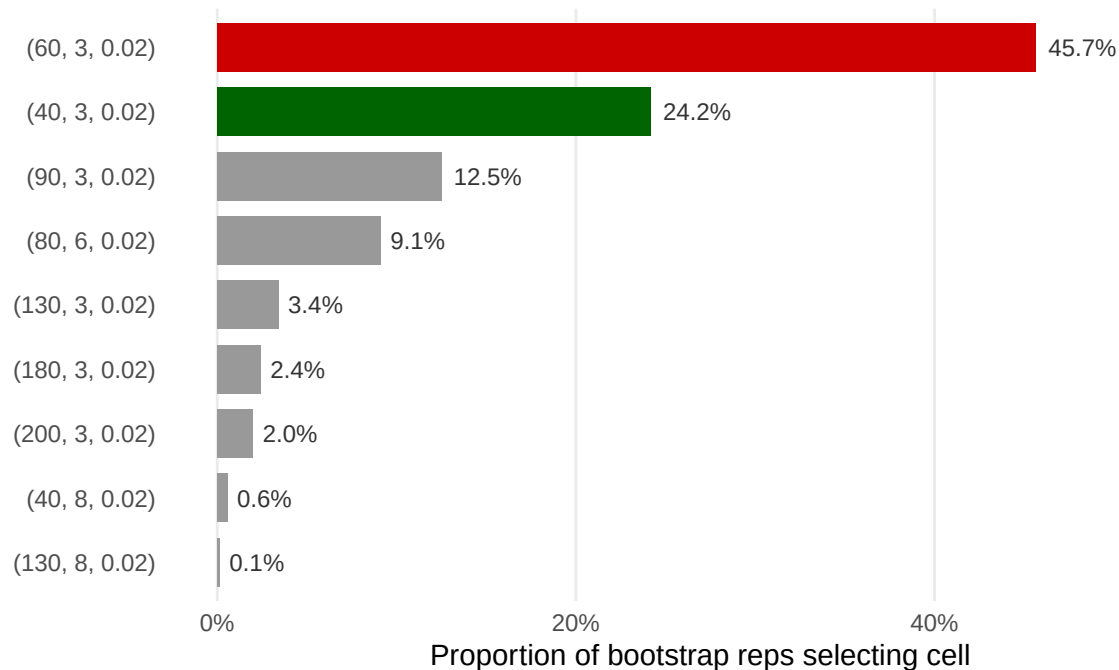

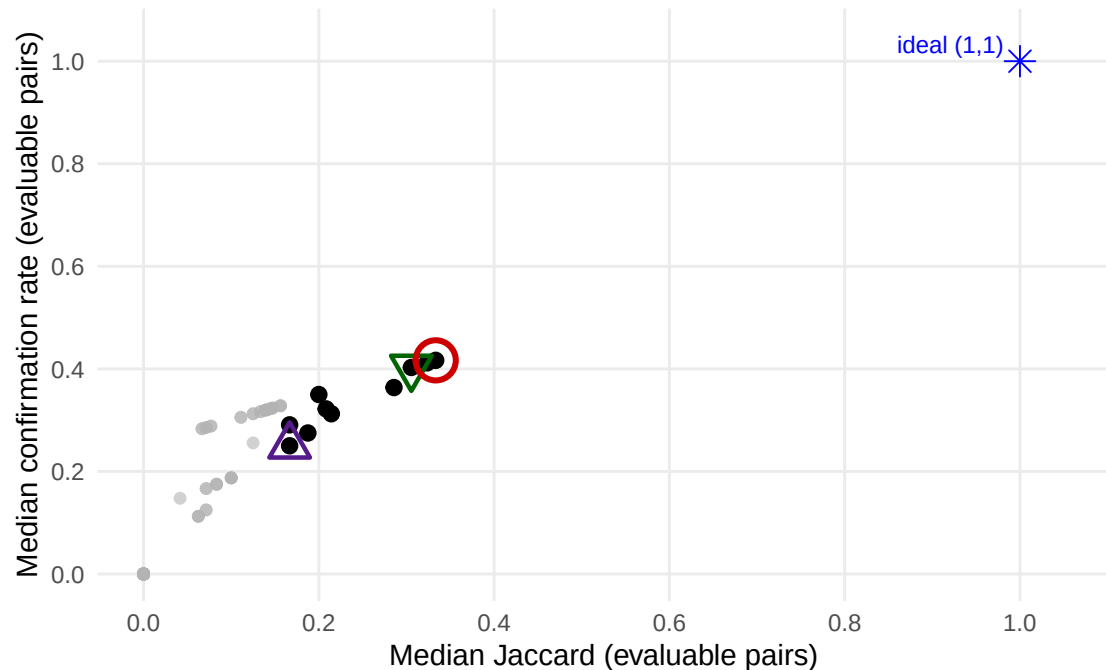

Markers: down-triangle = Looser, red circle = Primary, up-triangle = Tighter. Stage 1 and

B. Top-9 cells by bootstrap selection frequency

B = 1000 resamples; 297 (29.7%) failed; n_ok = 703. Method: lex.

Stage 2 select the same cell.

Primary (red square) looser tier (green square) other (grey square)

Three-tier calibration ladder (all real-grid cells; no-filter sentinel retired): Looser (DP=40, AD1=3, MAF=0.02); Primary (DP=60, AD1=3, MAF=0.02); Tighter (DP=100, AD1=6, MAF=0.02).

Stage 1: lex on observed cal_pairs selects (DP=60, AD1=3, MAF=0.02) as primary.

Stage 2: B = 1000 nonparametric pair-level bootstrap reruns the same procedure; the modal cell across reps is taken as the stabilized Primary. Stage 1 and Stage 2 selections agree. Joint stability of Primary: 45.7%.
